Open 'Crack' folder: 2) Use the batch file RemoveProtexis.cmd to remove Protexis service, Q: Help with understanding a theorem about functional analysis I am currently self-studying functional analysis from the book of Rosenblatt. In the book, there is a theorem, namely Theorem III.1.4, which is about a non-degenerate compact convex set K . Theorem III.1.4 Let $K \subset \mathbb{R}^n$ be a non-degenerate compact convex set. Then there is a norm $\|\cdot\|$ on \mathbb{R}^n , such that K is linearly isometric to the set $K' = \{(x_1, x_2, x_3, \dots, x_n) \in \mathbb{R}^n : |x_1| \leq |x_2| \leq \dots \leq |x_n| \leq 1\}$. The proof of this theorem is extremely easy. It is enough to select $\|(x_1, x_2, \dots, x_n)\|^2 = \sum_{i=1}^n |x_i|^2$. It's a norm. It's on the compact convex set. So it is complete, and hence non-degenerate. And $K = K'$. Now, I cannot understand why K' is a subspace? I know that subspaces are linearly isometric to them, but here I only have \mathbb{R}^n . I do not understand what kind of isometry is being used. By non-degenerate, we mean that there is no linear isometry that preserves the set except the identity. Or if that is not true, there are many linear isometries which map K to K' . Could you give me an explanation for this? Thank you. A: The theorem states that there exists a norm $\| \cdot \|$ with the property that K is isometr 595f342e71
